XX Sequences AAY52510-Y52522 represent proteolytic fragments of Dermatophagoides farinae high molecular weight mite allergen protein (HWM -map) composition. The HWW-map composition was isolated from a D. farinae homogenate by gel filtration, with each fraction being analysed for the presence of proteins that bound to IgE present in mite-allergic dog antisera. The HWW-map composition comprises mapA (a 109 kD protein) and mapB (98 kD). Mite allergenic proteins and peptides, and nucleic acids encoding them, may be used in therapeutic compositions to modify an animal's hypersensitivity reaction to mite allergens. Animals that may be treated include mammals and birds, especially felines, canines, equines,

The invention relates to an isolated mite allergenic protein of Dermatophagoides, designated Der HMW-map protein, and its related nucleic acid. The Der HMW-map protein is useful for eliciting an immune response against Der HMW-map protein. The protein or a reagent comprising a non-protein acceous epitope is useful for identifying an animal (e.g., dog, cat) susceptible to or having an allergic response to a mite. A composition is useful for desensitioning a host animal to an allergic response to a mite. The DNA and protein can be used in the detection of anti-per HMW-map antibodies in animal fluids, and inhibition of immunoglobulin (19) or Der HMW-map protein activity associated with a disease. Antibodies that bind to Der HMW-map are useful for inhibiting binding of proteins to 19E, to prevent immunocomplex formation, thus reducing hypersensitivity responses to mite allergens, and as vaccines against mite allergen hypersensitivity. Sequences AAU96314-AAU96342 represent Der HMW-map polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           humans, other pets, and work or domestic animals. The proteins or fragments may also be used to diagnose allergies via a skin test. The proteins and peptides can also to raise antibodies, which have a variety of potential uses. For example, they can be used as vaccines to passively immunise animals against dust mite hypersensitivity, as positive controls in test kits and as tools to recover desired dust mite
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 13 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Dermatophagoides farinae.

                                   This sequence represents Dermatophagoides farinae mite allergen protein (map) PDerf99-536, the mature form of pDerf98-555 (AAYS2523). PDerf98-536 CC has a molecular weight of 98 kD, comprising 536 amino acids, and is a component of the Dermatophagoides farinae high molecular weight mite component of the Dermatophagoides farinae high molecular weight mite component of the Dermatophagoides farinae high molecular weight mite component of the Dermatophagoides farinae high molecular weight mite component of the presence of proteins that bound to Igz present in mite-allergic dog antisera. Mite allergenic proteins and peptides, and nucleic acids encoding them, may be used in therapeutic compositions to modify an animal's hypersensitivity reaction to mite allergens. Animals that may be treated include mammals and birds, capitaes, canimals, equines, humans, other pets, and work or compositions to a skin test. The proteins and peptides can also be used to diagnose allergies via a skin test. The proteins and peptides can also be used to they can be used as vaccines to passively immunise animals against dust conclude mater and as tools to composition to the proteins and peptides can also be used to chapter a perfect of potential uses. For example, they can be used as vaccines to passively immunise animals against dust conclude mater and peptides can also be used to composition to mite hypersensitivity, as positive controls in test kits and as tools to conclude mater and as tools to conclude material materi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Best Local

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated mite allergenic protein of Dermatophagoides, designated Der HMW-map protein, and its related nucleic acid. The Der HMW-map protein is useful for eliciting an immune response against Der HMW-map protein. The protein or a reagent comprising a non-proteinaceous epitope is useful for identifying an animal (e.g., dog, cat) susceptible to or having an allergic response to a mite. A therapeutic composition is useful for desensitising a host animal to an allergic response to a mite. The DMA and protein can be used in the detection of anti-Der HMW-map antibodies in animal fluids, and inhibition of immunoglobulin (Ig)E or Der HMW-map protein activity associated with a disease. Antibodies that bind to Der HMW-map are useful for inhibiting between the contract of the contract of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              disease. Antibodies that bind to Der HMW-map are useful for inhibiting binding of proteins to IgE, to prevent immunocomplex formation, thus reducing hypersensitivity responses to mite allergens, and as vaccines against mite allergen hypersensitivity. Sequences AAU96314-AAU96342 represent Der HMW-map polypeptides of the invention

                                                                                                                         This sequence represents Dermatophagoides farinae mite allergen protein (map) PDerf98-555. PDerf98-555 has a molecular weight of 98 kD, compositiong 555 amino acids, and is a component of the Dermatophagoides farinae high molecular weight mite allergen protein (HWM-map) composition. The HWM-map composition was isolated from a D. farinae homogenate by gel filtration, with each fraction being analysed for the presence of proteins that bound to 1gB present in mite-allergic dog encoding them, may be used in therappeutic compositions to modify an animals hypersensitivity reaction to mite allergens. Animals that may be treated include mammals and birds, especially felines, canines, equines, humans, other pets, and work or domestic animals. The proteins or fragments may also be used to diagnose allergies via a skin test. The proteins and variety of potential uses. For example, they can be used as vaccines to passively immunise animals against dust mite hypersensitivity, as allergens from a mixture of proteins

                                                                                                                                                                                                                                                                                                                                                                                                                             Dermatophagoides, designated Der HNW-map protein, and its related nucleic acid. The Der HNW-map protein is useful for eliciting an immune response against Der HNW-map protein. The protein or a reagent comprising a non-proteinaceous epitope is useful for identifying an animal (e.g., dog, cat) susceptible to or having an allergic response to a mite. A therapeutic composition is useful for desensitising a host animal to an allergic response to a mite. The DNA and protein can be used in the detection of anti-Der HNW-map antibodies in animal fluids, and inhibition of immunoglobulin (Ig)E or Der HNW-map protein activity associated with a disease. Antibodies that bind to Der HNW-map are useful for inhibiting binding of proteins to Ig5 to prevent immunocomplex formation, thus reducing hypersensitivity responses to mite allergens, and as vaccines against mite allergen hypersensitivity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Dermatophagoides, designated Der HMW-map proteil, and its related nucleic acid. The Der HMW-map protein is useful for eliciting an immune response against Der HMW-map protein. The protein or a reagent comprising a non-proteinaceous epitope is useful for identifying an animal (e.g., dog, cat) susceptible to or having an allergic response to a mite. A composition is useful for desensitising a host animal to an allergic response to a mite. The DNA and protein can be used in the detection of anti-Der HMW-map antibodies in animal fluids, and inhibition of immunoglobulin (19) sor Der HMW-map protein activity associated with a disease. Antibodies that bind to Der HMW-map are useful for inhibiting binding of proteins to IgB, to prevent immunocomplex formation, thus reducing hypersensitivity responses to mite allergens, and as vaccines against mite allergen hypersensitivity. Sequences AA096314-AAU96342 represent Der HMW-map polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

PDerp98-490 chas a molecular weight of 98 kD, comprising 490 amino acids, and has a chigh degree of homology with the D. farinae mature 98 kD allergen, maps (AAY52525). Nucleic acid molecules encoding poerp98-490 were isolated from a D. pteronyssius cDNA library by hybridisation with a probe encoding the D. farinae high molecular weight map (HMW-map) composition. Mite allergenic proteins and peptides, and nucleic acids encoding them, compositions to modify an animal's compositions to modify an animal's compositions to modify an animal of them, compositions to modify an animal of them, compositions to modify an animal of the proteins and birds, especially felines, canines, equines, humans, conther pets, and work or domestic animals. The proteins and content pets, and work or domestic animals. The proteins and content pets, and work or domestic animals. The proteins and content pets, and the content pets and birds, especially felines, which have a variety of potential uses. For example, they can be used as vaccines to passively contential uses. For example, they can be used as vaccines to passively

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  닭
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC The invention relates to an isolated mite allergenic protein of CC Dermatophagoides, designated Der HMW-map protein, and its related nucleic CC acid. The Der HMW-map protein is useful for eliciting an immune response CC against Der HMW-map protein. The protein or a reagent comprising a non-CC proteinaceous epitope is useful for identifying an animal (e.g., dog, CC cat) susceptible to or having an allergic response to a mite. A CC therapeutic composition is useful for desensitising a host animal to an CC allergic response to a mite. The DNA and protein can be used in the CC detection of anti-Der HMW-map antibodies in animal fluids, and inhibition CC of immunoglobulin (Ig) & or Der HMW-map protein activity associated with a CC binding of proteins to IgE, to prevent immunocomplex formation, thus CC ceducing hypersensitivity responses to mite allergen, and as vaccines CC against mite allergen hypersensitivity. Sequences AAU96314-AAU96342 CC represent Der HMW-map polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents Dermatophagoides pteronyssius mite allergen protein (map) PDerp98-509. PDerp98-509 has a molecular weight of 98 kD, cc comprising 509 amino acids, and has a high degree of homology with the D farinae 98 kD allergen, mapB (AAY52523). Nucleic acid molecules encoding CC PDerp98-509 were isolated from a D. pteronyssius cDNA library by CC hybridisation with a probe encoding the D. farinae high molecular weight cmap (HMW-map) composition. Mite allergenic proteins and peptides, and nucleic acids encoding them, may be used in therapeutic compositions to modify an animal's hypersensitivity reaction to mite allergens. Animals that may be treated include mammals and birds, especially felines, canimes, equines, humans, other pets, and work or domestic animals. The proteins and peptides can also be used to diagnose allergies via a skin test. The proteins and peptides can also be used to raise antibodies, which have a variety of potential uses. For example, they can be used as vaccines to passively immunise animals against dust mite compositivity, as positive controls in test kits and as tools to recover desired dust mite allergens from a mixture of proteins.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 proteinaceous epitôpe is useful for identifying an animal (e.g., dog, cat) susceptible to or having an allergic response to a mite. A mite. The DNA and protein can be used in the allergic response to a mite. The DNA and protein can be used in the detection of anti-Der HMW-map antibodies in animal fluids, and inhibition of immunoglobulin (1g)E or Der HMW-map protein activity associated with a disease. Antibodies that bind to Der HMW-map are useful for inhibiting binding of proteins to IgE, to prevent immunocomplex formation, thus reducing hypersensitivity responses to mite allergens, and as vaccines against mite allergen hypersensitivity. Sequences AAU96314-AAU96342 represent Der HMW-map polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 2002-351888/38.

The Der HMW-map protein is useful for eliciting an immune response against Der HMW-map protein. The protein or a reagent comprising a non-proteinaceous epitope is useful for identifying an animal (e.g., dog, cat) susceptible to or having an allergic response to a mite. A therapeutic composition is useful for desensitising a host animal to an allergic response to a mite. The DNA and protein can be used in the detection of anti-Der HMW-map antibodies in animal fluids, and inhibition of immunoglobulin (Ig)E or Der HMW-map protein activity associated with a disease. Antibodies that bind to Der HMW-map are useful for inhibiting binding of proteins to IgE, to prevent immunocomplex formation, thus reducing hypersensitivity responses to mite allergens, and as vaccines against mite allergen hypersensitivity. Sequences AAU96314-AAU96342 represent Der HMW-map polypeptides of the invention
                                                                                                                                                                                 Tick chitinase and its encoded polynucleotide, applicable in develor diagnostics, agents for exterminating mite, remedies or preventives mite mediated-infections e.g. piroplasmosis and Q fever.
                                                                                                                                                                                                                                                                                        Fujisaki K, Nagasawa

The invention relates to a tick chitinase polypeptide, or its derivative that has chitinase activity. Also disclosed is a vector containing the polymucleotide, a transformant containing the polymucleotide, a process for producing the polypeptide by culturing the transformant, drugs containing the polypeptide, and a method for exterminating mites by administering an effective dose of the polypeptide. The protein and its encoded polymucleotide are applicable in developing diagnostics, agents and the polymucleotide are applicable in developing diagnostics, agents

Claim 1; Page 33-39; 47pp; Japanese.

for exterminating mites, remedies or preventives, including vaccines, for mite mediated-infections e.g. piroplasmosis, Q fever or viral encephalitis. The produced drugs are new and mostly likely less prone to

for biosynthesis and biodegradation, especially biosynthesis of vitamin B12. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene excepts and cell replication and modulate L. monocytogenes-related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaceutical and vaccines compositions for the treatment or prevention of infections by L. monocytogenes and related organisms. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to the genome sequence of Listeria monocytogenes EGD-e (see ABA03041). The genome sequence and fragments it are useful for selecting probes and primers for detecting genes in monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein encoded by the genome sequence of the present invention. Proteins expressed from the genome sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, antibodies, identification of L. monocytogenes and related organisms, antibodies, identification of L. monocytogenes and related organisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Chakraborty T, Domann E,

The invention relates to isolated polynucleotide (I) and polypeptide (II) creation (IC) is useful as hybridisation probes, polymerase chain (I reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used (I) is useful in gene therapy techniques to restore normal (II) activity of (II) or to treat disease states involving (II). (II) is useful in gene therapy techniques to restore normal (II) useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food (II) supplement. (II) and (II) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders (I involving aberrant protein expression or biological activity. The (I is a polypeptide and polymucleotide sequences have applications in (II) are useful for treations (II) are useful for meaning (II) are useful for treations (II) are useful for meaning (II) are useful for assess biodiversity (II) are useful for assess biodiv
